What are the safety requirements related to batteries & Battery rooms?

Employers must consider exposure to these hazards when developing safe work practices and selecting personal protective equipment (PPE). That is where Article 320, Safety Requirements Related to Batteries and Battery Rooms comes in.

Do lithium ion batteries need a battery room?

Lithium-ion batteries need a battery room if their capacity exceeds 20 kWh, according to fire codes. NFPA 855 outlines ventilation and safety requirements. Store batteries at a temperature of 59°F (15°C). Also, refer to NFPA 70E for further safety guidelines, and ensure proper exhaust ventilation for off-gas events.

What happens if a lithium ion battery is not stored properly?

On the negative side, improper storage can lead to serious risks. Lithium-ion batteries stored at high temperatures can swell, leak, or even catch fire. A study by the National Fire Protection Association (NFPA) in 2021 highlighted that 28% of battery fires occurred due to insufficient storage conditions.

How do you store a battery?

Humidity is another critical factor. Ideal storage conditions should maintain humidity levels below 60% to prevent corrosion and damage. Batteries exposed to high humidity can develop rust or leaks, which are hazardous. It is also important to store batteries at a partial charge.

Are battery storage systems dangerous?

There has been a fair amount of news about battery storage systems being involved in fire and explosion incidents around the world. Do not forget that these are not the only safety issues when dealing with batteries. Battery systems pose unique electrical safety hazards.

How safe is a battery room?

All electrical equipment or fittings installed in a battery room must be intrinsically safe to reduce the risk of arcing, flashing or ignition. The ventilation fans shall be provided with the single-phase squirrel-cage induction type motors suitable for direct-on-line starting.
