# Battery cabinet production pollution

## Overview

---

How does battery manufacturing affect the environment?

The manufacturing process begins with building the chassis using a combination of aluminium and steel; emissions from smelting these remain the same in both ICE and EV. However, the environmental impact of battery production begins to change when we consider the manufacturing process of the battery in the latter type.

What are the environmental factors affecting battery technology?

Overall, battery technologies associated with nickel, cobalt, and manganese exhibit the most significant environmental factor in terms of particulate pollution. Sodium-ion and solid-state battery technologies require particular attention due to their CO<sub>2</sub> emissions.

Are batteries harmful to the environment?

For batteries, a number of pollutive agents has been already identified on consolidated manufacturing trends, including lead, cadmium, lithium, and other heavy metals. Moreover, the emerging materials used in battery assembly may pose new concerns on environmental safety as the reports on their toxic effects remain ambiguous.

What is the environmental impact of ternary batteries?

In ternary batteries, Nickel (Ni) has a greater environmental impact compared to Cobalt, and the proportion of environmental impact attributed to nickel in ternary batteries is proportional to the proportion of nickel. For example, in NMC-111, the environmental impact score and the proportion of nickel are 4.60 and 66 %, respectively.

Are China's battery materials and technologies harmful to the environment?

This study assesses China's battery materials and technologies' environmental impacts. Results show that particulate pollution from nickel, cobalt, and

manganese production exceeds CO<sub>2</sub> emissions, whereas the reverse is true for other battery materials.

Are new battery compounds affecting the environment?

The full impact of novel battery compounds on the environment is still uncertain and could cause further hindrances in recycling and containment efforts. Currently, only a handful of countries are able to recycle mass-produced lithium batteries, accounting for only 5% of the total waste of the total more than 345,000 tons in 2018.
