What is a high power IGBT module (LV100 for industrial)?

A new high power IGBT module (LV100 for industrial) is under development, which has been optimized for the requirements of high power applications in the field of renewable energy converters, and industrial drives. The outline of the module housing is same as HVIGBT LV100 and in line with the new market defacto standard.

Do IGBT modules experience thermal cycling in high power industrial drive applications?

IGBT modules in high power industrial drive applications experience thermal cycling in case of fluctuating (or non-continuous) loads. Wind power converters are usually liquid-cooled with the cooler having a thermal time constant of a couple of seconds.

What is the difference between SiC vs IGBT inverter?

Hybrid switch configuration considered is 1:4 ratio (1 SiC + 3 IGBTs) Efficiency gain of full SiC Inverter and hybrid switch inverters vs IGBT inverter is from low load to medium load, generating advantages in power systems that operate most of the time below 40% load Hybrid switch inverter shows similar efficiency curve compared to SiC.

Should an inverter designer change from IGBT to SiC-MOSFET?

Therefore, if an inverter designer considers changing to SiC devices in future, the LV100 package is the right choice since the layout concept is ready for SiC. As result, a potential future change from Si-IGBT to SiC-MOSFET devices is feasible with less changes and redesign efforts.

What is a high power switch in an inverter?

The high-power switches are the most critical component in the inverter as they control the flow of current to the motor to generate motion. As such, the

switches' are monitored and protected by sensing their temperature, voltage and current throughout their operation.

Why are multiple IGBT chips connected in a Parallel configuration?

In high power IGBT modules, multiple chips are connected in a parallel configuration because IGBT chips sizes are limited and usually the rating maximum current is in a range of  $\sim 200\text{A}$  for IGBT chips with blocking voltages of 1200V or 1700V.
