Flywheel energy storage application in wind power generation

Overview

To address this issue, this paper proposes a hybrid energy storage-based power allocation strategy that combines flywheel and battery storage systems to smooth wind power fluctuations and enhance grid acceptance. Are flywheel energy storage systems environmentally friendly?

Flywheel energy storage systems (FESS) are considered environmentally friendly short-term energy storage solutions due to their capacity for rapid and efficient energy storage and release, high power density, and long-term lifespan. These attributes make FESS suitable for integration into power systems in a wide range of applications.

Can flywheel energy storage system array improve power system performance?

Moreover, flywheel energy storage system array (FESA) is a potential and promising alternative to other forms of ESS in power system applications for improving power system efficiency, stability and security. However, control systems of PV-FESS, WT-FESS and FESA are crucial to guarantee the FESS performance.

What is a flywheel system?

Flywheel systems are quick acting energy storage that enable smoothing of a wind turbine output to ensure a controllable power dispatch. The effectiveness of a flywheel depends on how well it can be controlled to respond to fluctuating power output from intermittent sources.

What is a flywheel energy storage system (fess)?

Flywheel energy storage systems (FESSs) satisfy the above constraints and allow frequent cycling of power without much retardation in its life span [1 - 3].

How do fly wheels store energy?

Fly wheels store energy in mechanical rotational energy to be then converted into the required power form when required. Energy storage is a vital component of any power system, as the stored energy can be used to offset inconsistencies in the power delivery system.

Are flywheels a good choice for wind farms?

There are already some applications of high-power and low- energy flywheel systems for smoothing wind power fluctuations in weak networks, and new requirements are emerging for stability improvement and protection of wind farms against network voltage dips. These applications are ideally suited to the high-power cycling capabilities of flywheels.
