How much capital does it take to build energy storage?

Given the clean energy targets that we see across Europe by 2050, we in Global Banking & Markets believe that building all that energy storage capacity will take up to \$250 billion in capital investment. This will require a mix between residential units and grid-scale energy storage.

Do investors underestimate the value of energy storage?

While energy storage is already being deployed to support grids across major power markets, new McKinsey analysis suggests investors often underestimate the value of energy storage in their business cases.

Is energy storage a good investment?

Imbalances, in return, are driven by more renewables. Energy storage is therefore well-positioned for an electricity market dominated by renewables and represents an interesting new asset class. It's also a potential hedge for players who already have classic renewable portfolios.

How does energy storage make money?

Energy storage is shifting electricity, and it makes money from buying, selling, and trading the difference between low- and high-priced hours in the market. Storage assets therefore depend on price spreads, which tend to be higher with more imbalances. Imbalances, in return, are driven by more renewables.

How do energy storage assets make money in Europe?

For short-duration energy storage assets, there are really three key revenue streams for energy storage assets in Europe. The first one is capacity payments, which have become a broadly implemented policy measure by governments to support system reliability and incentivize the installation of certain new power asset types.

Are energy storage systems in demand?

Energy storage systems are increasingly in demand to increase the effectiveness of solar power arrays, with the Energy Information Administration estimating in February that new utility-scale electric-generating capacity on the U.S. power grid will hit a record in 2025 after a 30% increase over the prior year.
