Industrial and commercial energy storage anti-backflow device

Overview

Why should you use an anti-backflow solution for energy storage systems?

During the discharge process of industrial and commercial energy storage systems, due to power fluctuations, changes in load power consumption and other reasons, reverse flow of electrical energy may also occur. The anti-backflow solution can effectively avoid this problem and ensure the safe and efficient operation of the energy storage system.

What is a photovoltaic system with anti-backflow?

After installing a photovoltaic system with anti-backflow, the power generated by the photovoltaic is only supplied to the local load, and the power generated by the photovoltaic energy storage system can be controlled not to be sent to the grid.

Does energy storage have a backflow problem?

As the scale of global industrial and commercial electricity consumption continues to expand, industrial and commercial energy storage technology has attracted more and more attention. The backflow problem in energy storage systems has always been a problem that troubles users.

What is backflow prevention?

Preventing the occurrence of backflow problems is called backflow prevention. In order to prevent backflow problems, anti-backflow devices came into being.

What is an anti-backflow controller?

So the anti-backflow device came into being. The principle of the anti-backflow controller is to control or cut off the output of the grid-connected inverter by monitoring the input power on the grid side, so that the photovoltaic grid-connected power generation system will not feed the grid.

How to install high-voltage anti-reverse flow detection?

Add a high-voltage Meter 3 on the 10kV side of the main transformer to perform high-voltage anti-reverse flow detection function. Meter3 needs to be connected at the high-voltage side. The high-voltage side wiring construction is difficult and requires dedicated personnel.
