**Is the output voltage of the  
outdoor power supply  
confirmed to be 220V**

## Overview

---

Why does my power supply say 230V?

The power supply says 230v only on it, because the components in that circuit that raises the voltage up to around 400v were chosen in such a way that they're perfectly capable of working up to the maximum output power advertised but only if the initial mains voltage is high enough.

How do I select a power supply?

Factors to consider when selecting a Power Supply are provided in the following diagram. Each Power Supply has an input voltage range. Select the (2) Output Capacity (Voltage × Current) Power Supply The maximum load capacity must be according to the less than the maximum output available input capacity of the Power Supply.

What is forward current in a power supply?

Forward current (IF): Twice the rated output current of the Power Supply or higher. output voltage settings of Power Supplies A and B just enough to allow for the voltage drop (VF) on diodes D1 and D2. Also, make sure that the diodes are sufficiently cooled so that their temperatures remain below the catalog value.

What is maximum output power?

The maximum output power = the maximum output current × the rated output voltage so there is no problem if it is confirmed that one of them is not exceeded. The maximum output power < the maximum output current × the set output voltage so it is limited with the maximum output power (the output current must be decreased).

What does if mean in a power supply?

the Power Supply or higher. Forward current (IF): Twice the rated output current of the Power Supply or higher. The floating output (the primary and

secondary circuits are separated) enables creating  $\pm$ outputs using two Power Supplies. You can create positive/negative outputs for any model for which direct operation is possible.

How does a power supply work?

The power supply has a circuit inside that takes the 230v  $\pm$ 10% AC voltage and converts it to DC voltage and then uses some components to boost (raise) the voltage up to around 400-420v DC. Then, this high voltage of around 400v is converted by the power supply to 12v, 5v and 3.3v
