Lithium battery pack protection module

Overview

The primary safety circuits manage all the basic safety functions: over-voltage, under-voltage, over-current and sometimes over and under temperature. Additionally, most of the world class designs that we produce also include a secondary safety circuit which is there to protect the cell.

The protection circuits are contained in what is commonly referred to as the Protection Circuit Module (PCM). While there are many off the shelf PCMs that you can buy, each.

Many of these protections are resettable but in fail safe environments they can be designed so that they are not. The two key manufacturers of these ICs are Texas Instruments (TI) and.

Prioritize safety and reliability with our expertly engineered custom battery packs featuring advanced protection circuits. Consult our engineering team for a customized, fail-safe solution.

As many of the largest battery cell manufacturer's move away from smaller applications to focus on the electric vehicle market, a lot of the newer and smaller companies are now.

A protective PCB—often called a PCM or as part of a BMS—sits between the cell array and the pack terminals. It continuously monitors each cell's voltage and current.
