Ngerulmud Micro Grid-connected Inverter

Overview

What should a user not do when using a grid connected inverter?

The user must not touch the board at any point during operation or immediately after operating, as high temperatures may be present. Do not leave the design powered when unattended. Grid connected inverters (GCI) are commonly used in applications such as photovoltaic inverters to generate a regulated AC current to feed into the grid.

What is a grid-connected solar microinverter system?

A high-level block diagram of a grid-connected solar microinverter system is shown in Figure 4. The term, “microinverter”, refers to a solar PV system comprised of a single low-power inverter module for each PV panel.

What is the control design of a grid connected inverter?

The control design of this type of inverter may be challenging as several algorithms are required to run the inverter. This reference design uses the C2000 microcontroller (MCU) family of devices to implement control of a grid connected inverter with output current control.

Are inverters able to inject real power into a grid?

Inverters have assumed that the grid is strong and will provide a stable and clean voltage and that they are able to inject real power into the grid without undue impact on its operation. References is not available for this document.

.

Can a grid connected inverter be left unattended?

Do not leave the design powered when unattended. Grid connected inverters (GCI) are commonly used in applications such as photovoltaic inverters to generate a regulated AC current to feed into the grid. The control design of

this type of inverter may be challenging as several algorithms are required to run the inverter.

What happens if a microinverter is not able to detect a grid shutdown?

In the event that the local load resonates near the operating frequency before the grid was removed, the microinverter will see a small change in active and reactive power, and will not be able to detect that the grid has shut down. This is known as an island condition and is a Non-Detection Zone (NDZ) for the microinverter.
