What is a p/q control strategy for photovoltaic grid-connected inverters?

In photovoltaic grid-connected (GC) and DG systems, one of the objectives that the grid-connected inverters (GCI) is the control of current coming from the photovoltaic modules or DG units. In this way, this paper describes a simple P/Q control strategy for three-phase GCI. Initially, the proposed control of the grid side is introduced.

Can APEO-based p-q control improve the performance of a three-phase grid-connected inverter?

In cases of both nominal and variable reference active power values, the proposed APEO-based P-Q control method can improve the performance of a three-phase grid-connected inverter in a microgrid compared to the traditional Z-N empirical method, the adaptive GA-based, and the PSO-based P-Q control methods.

How a grid-connected inverter is designed in a microgrid?

The inverter is designed from a universal bridge. Since we are using the topologies of directly connected inverter to PV cell thus, we use the grid-connected inverter's P-Q control strategy in the microgrid [11 – 14]. In the inverter's P-Q control, the inverter's grid output current and output current are compared.

What is p-q control scheme for grid-connected inverter in microgrid?

Since we are using the topologies of directly connected inverter to PV cell thus, we are using the P-Q control strategy of the grid-connected inverter in the microgrid. The RC block is used to match the PV terminal's load line to draw maximum power from the PV array. In this work, the P-Q control scheme for the inverter has been used.

Can intelligent p-q control be used in a microgrid?

Encouraged by the aforementioned analysis, a novel intelligent P-Q control method is proposed for three-phase grid-connected inverters in a microgrid by using an adaptive population-based extremal optimization (APEO).

What is p-q control scheme for PV inverter?

In this work, the P-Q control scheme for the inverter has been used. In this scheme, the terminal current and voltage of the PV are given to an MPPT algorithm. The current from the inverter side and voltage from the grid side are transformed using parks transformation.
