How can multi-energy hybrid power systems solve the problem of solar energy?

The developments of energy storage and multi-energy complementary technologies can solve this problem of solar energy to a certain degree. The multi-energy hybrid power systems using solar energy can be generally grouped in three categories, which are solar-fossil, solar-renewable and solar-nuclear energy hybrid systems.

Can solar-based multi-energy complementary systems solve the problems of intermittent and low utilization rate?

However, solar energy still has the problems of intermittent and low utilization rate. Different kinds of solar-based multi-energy complementary systems were proposed to solve these problems. This work conducts a comprehensive R&D work review on seven kinds of solar-based multi-energy complementary systems.

What is the methodology of a multi-energy complementary power system review?

The methodology of this review work could be divided into four steps. The first step was to determine the theme of the review, which is multi-energy complementary power systems based on solar energy. The second step was to search and classify the relevant references.

How many types of solar-based multi-energy complementary systems are there?

This work conducts a comprehensive R&D work review on seven kinds of solar-based multi-energy complementary systems. For different kinds of solar-based hybrid systems, the typical system configurations, solar subsystem types, output products and typical performance parameters are separately summarized.

Is there a complementarity evaluation method for wind and solar power?

Han et al. have proposed a complementarity evaluation method for wind, solar, and hydropower by examining independent and combined power generation fluctuation. Hydropower is the primary source, while wind and solar participation are changed in each scenario to improve power system operation.

What are solar thermal systems combined with coal-fired power plants?

The solar thermal systems combined with coal-fired power plant mainly utilize the parabolic trough collector system (PTCS) or tower receiver system (TRS). Due to the different operating temperature of the two kinds of solar receiving systems, the integration modes and positions are different.
