**BUILT-IN DUAL FIRE PROTECTION MODULE**

## Overview

---

Lithium-ion battery packs are complex assemblies that include cells, a battery management system (BMS), passive components, an enclosure, and a thermal management system. What is a lithium ion battery pack?

Lithium-ion battery packs include the following main components: Lithium-ion cells – The basic electrochemical unit providing electrical storage capacity. Multiple cells are combined to achieve the desired voltage and capacity. Battery Management System (BMS) – The “brain” monitoring cell conditions and controlling safety and performance.

What are layered structures in lithium ion batteries?

The layered structures produce cells with sloping voltage profiles, where cell balancing is straightforward at any state of charge. The positive electrodes that are most common in Li-ion batteries for grid energy storage are the olivine LFP and the layered oxide,  $\text{LiNi}_x\text{Mn}_y\text{Co}_{1-x-y}\text{O}_2$  (NMC).

How to use lithium-ion batteries correctly?

How to use lithium-ion batteries correctly □ Avoid excessive discharge. When the device prompts "low battery", it should be charged; Don't charge until the device shuts down automatically. The battery has been discharging excessively. This can affect battery life. Avoid overcharging. The charger should be unplugged when it is indicated to be full.

What is a Li-ion battery pack?

At the base of every Li-ion battery pack is the battery cell or cells. A pack can contain one cell or many cells configured to achieve higher capacity or output voltage. This is achieved by connecting cells in parallel or series, and we'll explore this much further in our next blog.

What are lithium ion batteries?

Figure. 1 Lithium-ion batteries are rechargeable batteries that mainly rely on

lithium ions moving between the positive and negative electrodes to work.

How is  $\text{Li}^+$  embedded in a battery?

In the process of charging and discharging,  $\text{Li}^+$  is embedded and de-embedded back and forth between the two electrodes: when charging the battery,  $\text{Li}^+$  is de-embedded from the positive electrode and embedded in the negative electrode through the electrolyte, which is in a lithium-rich state; when discharging, the opposite is true.
