# Regulations on the installation of uninterruptible power supply for communication base stations

## Overview

---

What is an uninterruptable power supply system (UPS)?

2.1 An uninterruptable power supply system (UPS) is defined as a device which for a specific period of time supplies continuous power to radio equipment independent of any power failures in the ship's main or emergency source of electric energy.<sup>2</sup> rechargeable accumulator batteries, complying with the requirements of annex 1.

What are the requirements for UPS installation?

Further aspects of the UPS installation are also subject to regulation; these include environmental protection (IP) standards, wiring regulations, equipotential bonding and earthing, and other factors. Below, we review the most important of these standards.

What are the standards relating to ups?

The question of standards relating to UPSs involves many aspects. There are safety, EMC compliance and performance considerations for the UPS equipment itself, and limitations for the equipment's impact on the power network. Lead-acid batteries have their own regulations relating to selecting, safe operation, testing, maintenance and replacement.

What are the requirements for a power ups?

Part 1: General and Safety Requirements: The standard applies to electronic indirect AC converter systems with an electrical energy storage device in the DC link. Primarily, the UPS must ensure continuity of an alternating power source, but it may also serve to improve power quality and keep supplies within specified characteristics.

What is the EMC standard for a single UPS?

This EMC standard applies to single UPSs for installation in any operator-accessible area or in separated electrical locations, connected to either

industrial or public low voltage networks. The EMC standard takes precedence over all aspects of the Generic standards and no additional testing is necessary. Part 3: Performance.

Why should a ups be protected from a short-circuit?

The UPS should be so designed and constructed that it is protected against damage resulting from disconnecting the batteries or, with the battery disconnected, short-circuiting the UPS battery connections. If this protection is provided by electronic means it should automatically reset following removal of the open or short-circuit conditions.
