

## SolarTech Power Solutions

# UPS battery cabinet has voltage to ground

## Overview

---

Does a stationary UPS need a single output receptacle?

Exception: This requirement does not apply to a stationary UPS provided with a single output receptacle. One result of breaking the input Neutral and Hot connections when operating on battery is that you may be able to measure voltage between Neutral and Ground at the output receptacles when the UPS is on battery.

How does a battery ground fault affect an ups?

The same condition will exist in a UPS system with a (single) battery ground fault. The unit will continue to run, but a battery ground leakage detection monitor will sense the ground current, and then can trigger an alarm on the monitor, and/or through a “building alarm” in the UPS.

Do ul batteries need a ground break?

Recently UL has reversed their position on continuous neutrals and has made changes to their standards, which require both hot and neutral to be broken during battery operation. Ground however is never broken.

Can a low watt bulb cause a problem in an ups?

L1 & L2 should both have ~2xxV RMS between them but be floating relative to pretty much everything else. Tie one of them to the ground pin via the low-watt bulb and pretend that is neutral. In \*theory\* if this causes a problem in the UPS it should be limited by the bulb lighting up and not cause any damage.

Should I use an inverter for a 208v ups?

Any application where you are forcing the UPS to always function on battery or always boost or trim (IE: using a 208v UPS in a 240v environment) will likely result in premature failure. Using an inverter designed for your application would result in better performance and reliability. Posted: 2021-06-30 08:52

PM .

Does a negative grounded battery system provide a local bonding?

Wayne, as you stated, using a negative grounded battery system appears to provide a "local" bonding - however, in backup mode, it is the only bonding that occurs (the mains are disconnected). Caveat needed!!
