Vientiane All-vanadium Liquid Flow Battery Environment

Overview

Are vanadium redox flow batteries viable?

Among these systems, vanadium redox flow batteries (VRFB) have garnered considerable attention due to their promising prospects for widespread utilization. The performance and economic viability of VRFB largely depend on their critical components, including membranes, electrodes, and electrolytes.

Will flow battery suppliers compete with metal alloy production to secure vanadium supply?

Traditionally, much of the global vanadium supply has been used to strengthen metal alloys such as steel. Because this vanadium application is still the leading driver for its production, it's possible that flow battery suppliers will also have to compete with metal alloy production to secure vanadium supply.

Why are innovative membranes needed for vanadium redox flow batteries?

Innovative membranes are needed for vanadium redox flow batteries, in order to achieve the required criteria; i) cost reduction, ii) long cycle life, iii) high discharge rates and iv) high current densities. To achieve this, variety of materials were tested and reported in literature. 7.1. Zeolite membranes.

Are all-vanadium RFB batteries safe?

As an important branch of RFBs, all-vanadium RFBs (VRFBs) have become the most commercialized and technologically mature batteries among current RFBs due to their intrinsic safety, no pollution, high energy efficiency, excellent charge and discharge performance, long cycle life, and excellent capacity-power decoupling .

Why are vanadium batteries so expensive?

Vanadium makes up a significantly higher percentage of the overall system cost compared with any single metal in other battery technologies and in

addition to large fluctuations in price historically, its supply chain is less developed and can be more constrained than that of materials used in other battery technologies.

How efficient are flow batteries compared to Li-ion batteries?

Flow batteries average between 70%-85% round-trip efficiency, compared with 90%-95% average for Li-ion batteries, potentially affecting the economics of projects based around bulk shifting of energy.
