

## SolarTech Power Solutions

# What types of containers can generate electricity

## Overview

---

These solutions are available in various configurations, including battery-powered, solar-powered, and hydrogen fuel cell containers, each with distinct advantages. What is a containerized energy storage system?

A Containerized Energy-Storage System, or CESS, is an innovative energy storage solution packaged within a modular, transportable container. It serves as a rechargeable battery system capable of storing large amounts of energy generated from renewable sources like wind or solar power, as well as from the grid during low-demand periods.

Can I add more container units to my energy storage system?

Each container unit is a self-contained energy storage system, but they can be combined to increase capacity. This means that as your energy demands grow, you can incrementally expand your CESS by adding more container units, offering a scalable solution that grows with your needs.

What are the different types of energy storage systems?

One of the earliest and most accessible energy storage system types is battery storage, relying solely on electrochemical processes. Lithium-ion batteries, known for their prevalence in portable electronics and electric vehicles, represent just one type among a diverse range of chemistries, including lead-acid, nickel-cadmium, and sodium-sulfur.

What type of batteries are used in energy storage systems?

Lithium-ion batteries are the most widely used type of batteries in energy storage systems due to their decreasing cost over the years. As of 2024, the average cost for lithium-ion batteries has dropped significantly to R2,500 per kilowatt-hour (kWh), making energy storage systems more financially viable and accessible for businesses.
